Liposomes, sphere-shaped vesicles consisting of one or more phospholipid bilayers, were first described in the mid-60s. Today, they are a very useful reproduction, reagent, and tool in various scientific disciplines, including mathematics and theoretical physics, biophysics, chemistry, colloid science, biochemistry, and biology. Since then, liposomes have made their way to the market.

Liposome: classification, preparation, and applications ...

Liposomes consist of vesicles composed of bilayers or multilayers that contain or have phospholipids and cholesterol surrounding an aqueous compartment. Drug is entrapped within the liposome and is released from the liposome for absorption at

For these studies, the authors used EF24-liposomes prepared by extrusion process. At the end of the incubation period, the liposomes were monitored for particle size and EF24 leakage into extravesicular space. For serum challenge, EF24-liposomes were incubated for 24 h at 37 °C with equal volume with normal human serum.
